

Is it true that if you don't move, a Tyrannosaurus can't see you?

Frogs and toads have vision based on movement. If a prey animal doesn't move the toad can't see it. However, a Tyrannosaurus isn't much like a frog or a toad, it's more like a bird or a crocodile. And a bird or a crocodile can see you just fine whether you're moving or not. So if you ever run into a live Tyrannosaurus Rex, don't freeze you – instead, run like a thief.
