How do you measure up to man versus mammoth?

1. Start by sketching in the basic shapes: a big oval body, rectangular head, straight legs, columnar limbs, a mammoth head a short, thick neck to support the heavy head and tusks. This step and the one that follows should be sketched lightly in pencil.

2. Next round out the contours of the head and smooth the basic body shapes together. Note how the curved lines of the legs relate to the straight lines.

3. Finally, go over the final outline in ink, adding details like the wrinkles in the skin and shading. Erase the pencil lines and you're done.

Example: 4' 10" = 2' + 2"
= 128 + 24
= 152 inches

125 cm = 50 inches
4' 10" = 2' + 2"
