

## How big was Velociraptor?

Velociraptor was 180 centimeters (6 feet) long, about as long as an adult human is tall. That sounds man-sized, but it's important to keep in mind that about half of that length is tail, which doesn't add much to the animal's bulk. Velociraptor only had a head the size of a hot dog bun, and the total mass of the animal was only 15 kilograms -- about the same as a standard poodle.
