

What was the fastest dinosaur? It was Velociraptor, right?

No. The dinosaurs with the highest hind limb indices (see question #5) were the ostrich dinosaurs, or ornithomimids. Ornithomimids include *Struthiomimus*, *Ornithomimus*, *Dromeicimus* and *Gallimimus*. In the 50 meter dash, any one of these would have left *Velociraptor* in the dust.

Struthiomimus skeleton on display in the museum
