

Teaching Trunks

General Geology & Economic Geology in Wyoming

From plate tectonics, to volcanoes, to economic geology, this trunk has it all. Understanding the processes that shape the Earth can seem daunting, but with the Geology Trunk, things are made easy with great posters, books, rock samples, and tools to help demonstrate what can happen to rock layers.

The first drawer of teaching tools is a collection of painted carpet padding simulating different rock layers. They can be bent, twisted, and one even has an area to show how an igneous intrusion forms.

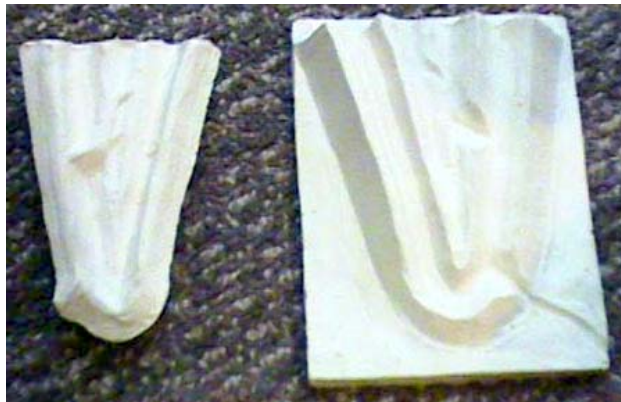

The second and third drawers contain samples of various igneous and sedimentary rocks.

The third drawer also has a two-part model of an anticline to help show how what happens after weathering takes its toll on layers of rock.

Put these tools together with a great selection of large full color posters, great books for both teachers and students, and informative videos, and you have a great way to teach and learn about Geology and the world around us.
